AI use note

Fixed policy document: the same for every organisation assessed. Required by the Global Ethical Standards and Policy (section 3.4): AI used in research must have documented guidance on data protection and reliability.

What the AI does and never does

Agent	Does	Never does
Researcher	Decides what to search and read; follows leads to primary sources	Opens pages it was not shown; researches private individuals
Analyst	Labels each source (allegation, investigation, finding…) with an exact quote and the event's date	Upgrades an allegation to a fact
Tracer	Traces serious open issues back to their origin and forward to their outcome	Guesses an outcome it did not find
Judge	Drafts the six template b answers, with both sides	Treats an empty search as "no risk"
Challenger	Argues against each answer; the judge must reply	Has the final word: a person does
(Code)	Scores with the manual's fixed rule; routes	*No AI decides the risk level or the partnership*

How reliability is ensured

Control	How
Traceability	Every finding has a source link and an exact quote, checked word for word
Limits of each source	Each row says what is safe and not safe to infer
No invented sources	The agent can only open links that appeared on a page
Identity	Similar names marked "not confirmed"; namesakes set aside
Second opinion	A challenger agent tests every answer; the debate is shown
Consistency	Fixed searches and scoring rule; rule-based baseline; 33 answer-key checks; 48 automated tests; repeat-run consistency measured
Transparency	Every file says who prepared it: partner, third party, staff or AI
Human review	Named reviewer, conflict-of-interest declaration, owns every decision

Data protection

Inputs	Organisation name and relationship details only; no personal data
Sources	Public web pages and documents only; robots.txt obeyed; no logins or paywall bypass
AI provider	Public page text and the case card go to the chosen provider (Anthropic or OpenAI) under its API terms; cached so nothing is sent twice
Storage	Locally in `results/`; in production, WaterAid systems with named-contact access (guide 1.6)

For WaterAid to confirm

- Trusted source list and reliability ratings (`config/sources.json`, `criteria.json`)
- Which LLM provider, if any, is acceptable
- The two policy contradictions (fossil fuels; alcohol)
