Review workflow, uncertainty and cost

Fixed process document: the same for every organisation assessed. The cost figures come from the three test cases (rule-based baseline); `python scripts/effort_estimate.py` adds any case you have run, including real organisations.

1. Review workflow

Staff enter case card → agent researches (minutes) → reviewer checks the report → routed by risk level

Step	Reviewer does
1	Declares no conflict of interest (guide 1.5). The review screen will not save without it
2	Reads *At a glance*, *Risks indicated* and *Needs your judgement*
3	Spot-checks the sources behind each yes or unclear answer
4	Reads *Limits*; decides whether more research is needed
5	Accepts or changes each call; saved as a staff record (`07_review.json`)

Level	Next step	Who decides	Form
Low	Sign off	Team lead, manager or director	Template c §3
Medium	Full ethical check (guide 2.1)	Function or Regional Director	Template e
High	Drop, or full ethical check	Function or Regional Director; may escalate	Template e

Escalate (guide 3.2) if high-risk, complex or contentious: Director → Chief Executive → Global Executive → Federation Board.

2. Uncertainty

Situation	What the tool does
Evidence thin or conflicting	Answers **unclear** and states the question that would settle it
Making any call	Judge builds the case for and against; must rule out the other answers with a reason
One reading could be wrong	A **challenger agent** argues the other way; the judge must reply; both shown
Each source	States what is **safe** and **not safe** to infer
Nothing found	Says "in the sources searched", never "no risk"
Issue with no known ending	Tracer agent searches for the outcome; if none is found, says so and asks staff
Old or repeated news	Timelines by event date; current status of each issue; independent sources counted once
How much rides on open questions	Shows a **worst case**: the level if every unclear were yes
Searches fail	Some: red warning. All: run stops

3. Cost

Case	Manual (guide 1.3)	Answers to review	Sources to check	Review with tool	Saved
Brightwell (clean)	60–120 min	0	0	~6 min	54–114 min
Northstream (medium)	60–120 min	3	5	~31 min	29–89 min
Corvane (ambiguous)	60–120 min	6	8	~46 min	14–74 min

How review time is modelled	Report words ÷ 200 per min + 5 min per source to check + 5 min overhead
Running cost (AI, live web)	~45 searches and ~40–90 AI calls per organisation, mostly on the cheaper analyst model; add prices in `config/settings.yaml`
Maintenance	Keep `sources.json` and `criteria.json` current; re-run tests after any change
To prove real benefit	Pilot on 20–30 past cases: issues missed, false alarms, reviewer agreement, real time
